

2nd half syntax : $=\text{RIGHT}(\text{text}, \text{LEN}(\text{text})/2)$

Ex : $=\text{RIGHT}(A2, \text{LEN}(A2)/2)$

OP : ANA

round : rounds a no. normally based on the next digit, more than 5 $\rightarrow$ rounds up, less than 5 $\rightarrow$ rounds down.

syntax : $=\text{ROUND}(\text{number}, \text{num-digits})$

Ex : $=\text{ROUND}(25.678, 2)$, $=\text{ROUND}(25.674, 2)$

OP : 25.68, 25.67

roundup : always rounds the number away from zero

syntax : $=\text{ROUNDUP}(\text{number}, \text{num-digits})$

Ex : $=\text{ROUNDUP}(25.671, 2)$

OP : 25.68

even though 3rd decimal is 1, it still rounds up

round down : always rounds the no. towards zero, regardless of the next digit.

syntax : $=\text{ROUNDDOWN}(\text{number}, \text{num-digits})$

Ex : $=\text{ROUNDDOWN}(25.679, 2)$

OP : 25.67

even though 3rd decimal is 9, it doesn't round up

25/9/2026.

PAGE:

1. Find () : This function searches for a specific character or text inside another text and returns its position no.
★ It's case-sensitive.

Syntax: =FIND (find-text, within-text, [start-num])

find-text = The character / text we want to find
within-text = The text where we want to search
[start-num] = optional : position from which excel should start searching.

Ex: =FIND ("a", "sanjana"), =FIND ("a", A2)
O/P: 2

2. SEARCH () : This function finds the position of specific text inside another text.
★ This is not case sensitive.

Syntax: =SEARCH (find-text, within-text, [start-num])

Ex: =SEARCH ("A", "sanjana"), =SEARCH ("A", A2)
O/P: 2

3. Separating the names into first name and second name
Last

Suppose we have Sanjana LR in the A2 cell
we want to separate
first name $\rightarrow$ Sanjana
Last name $\rightarrow$ LR

How the syntax works.

$\rightarrow$ = LEFT (text, num_chars)

text = The original text

num_chars = no. of characters to extract from left

Inside the formula.

$\rightarrow$ FIND (" ", A2) = This finds the position of the space

$\rightarrow$ Then (-1) will remove the inside space. becz

FIND (" ", A2) gives 8, becz the space is at position 8, so -1 is used

Ex: =LEFT(A2, FIND (" ", A2) - 1)

O/p: Sanjana

4. Separating Last Name.

we have Sanjana LR in cell A2

How Syntax works:

→ $=\text{MID}(\text{text}, \text{start-num} - \text{num-char})$

text : A2

→ $\text{FIND}(" ", A2)$ = This finds the position of the space in the full name, this returns 8

→ Then $(+1)$ = we don't want to start extracting from the space. we want to start from the first letter of the last name

So $8+1=9$, position 9 is L

→ $\text{LEN}(A2)$ = counts the total no. of chars in A2, so length is 10

Ex: $=\text{MID}(A2, \text{FIND}(" ", A2) + 1, \text{LEN}(A2))$

Op: LR

5. CONCAT () : combines multiple text values into one text string.

Sanjana = (L2) LR = (M2)

Syntax: $=\text{CONCAT}(\text{text1}, \text{text2})$

Ex: =CONCAT (L2, " ", M2)

we need space between if so only space is specified

o/p: Sanjana LR

concat the first name and last name as
Hi Sanjana LR gm

Ex: =CONCAT ("hi", " ", L2, " ", M2, " ", "gm")

o/p: hi Sanjana LR gm

6. Textjoin () : combines multiple text values and allows us to specify a delimiter b/w them

for ex: space " ", comma ",", Hyphen "-"

syntax: =TEXTJOIN (delimiter, ignore_empty, text1, text2)

delimiter = character placed b/w each text value
ignore_empty = (True) ignore empty cells,
(False) includes them

Ex:

Ex: =TEXTJOIN (" ", 1, L2, M2)

o/p: Sanjana LR

7. Substitute (c): This replaces specific text with another text.

Syntax: `=SUBSTITUTE (text, old_text, new_text)`

Ex: `=SUBSTITUTE (B2, "a", "@")`

O/p: s@nj@n@ LR

8. Replace (c): This replaces characters based on their position in a text string.

Syntax: `=REPLACE (old_text, start_num, num_chars, new_text)`

old_text = original text

start_num = position where replacement should begin

num_chars = No. of characters to replace.

new_text = New text to insert

Ex: `=REPLACE (B2, 2, 1, "@")`

O/p: s@njana LR
