POWER QUERY

Power Query is an excel tool used to import, clean, transform, and combine data from different sources such as websites, Excel files, databases and csvfile.
It helps us prepare data for analysis without manually editing every row.

Steps to load data from the web :

- Open Excel
- Click the Data tab
- Select get data → from other sources → from web (In some excel version, we can directly select from web)
- Open the website containing the required data
- Copy the URL of the website from the address bar
- Paste the copied URL into the URL box in excel
- Click OK, choose basic
- In the Navigator window, select the required tabel or data
- Click Transform data if you want to clean or modify the data, or click load to import it directly

DATE: PAGE:

- The data will be loaded into your excel ~~workbook~~ work sheet

* When we load data into power query and make any changes, such as removing columns, filtering rows, or changing data types, those changes are recorded under "applied steps" on the right side of the Power Query

Advantages of Power query

- Reduces manual data entry and cleaning work
- Data cleaning will be performed
- Changes data types, split columns, renames columns this is called data transformation
- Easy refresh, updates imported data using refresh option
- Handled large data
- Reduces errors, minimizes mistakes caused by repetitive manual work
- Supports multiple sources, imports data from websites, excel files, csv files, databases & other supported sources.
