- Click on the checkbox below use the first row as column heading
- Click next and choose the required sheets.
- And click on finish.
- This shows a success msg

How to build relationship b/w tables?

- First choose the main table in all of the choosed tables.
- How to choose the main table is that it should have the same row data in both table. It does not depend on the column name it depends on row datas.
- Then next click on the diagram view in the view tab in home tab.
- Keep the main table in the middle
- & drag and drop the common column from both table as match the following
- After that click pivot table then choose New workbook.

Why to create a relationship?

without a relationship excel dosnot automatically know which customer belongs to each order when you analyze fields from both tables
