Pivot tables

It is a powerful tool used to summarize, organize analyze & compare large amounts of data quickly without changing the original datasets.
It helps us calculate totals, averages, maximum values, and ~~main~~minimum values and counts based on categories such as department, region employee or city

Example: If a company has employee salary details a pivot table can help us find

- A total salary of each department
- The max salary of in each department
- The avg salary of each department
- The no. of employees in each city.

Steps to create pivot table

- Select the data manually
- Insert a pivot table by going to Insert tab
- check the data range
- choose new worksheet
- click ok
- The pivot table fields displays the 4 main areas filters, columns, rows, values
- Drag and drop the fields.

Example: find the total salary of each department

Employee name	Department	salary
kumar.M	Training	10,000
Smitha.R	Accounts	12,000
Anjali.K	Marketing	11,250
R.Vasu	R&D	12,000
sanjana	Training	16,250
Jharna.	Accounts	6,400

Steps:

- select any cell in employee dataset
- Go to insert → pivot table
- select the required data range.
- click new worksheet
- Drag epartments into the row
- Drag basic into the values area
- Calculations in values must be sum

Department	sum of salary
Training	26,250
Accounts	18,400
Marketing	11,250
R&D	12,000
Grand total	67,900
