Text to Columns

Text to columns is an excel function that splits data from one column into multiple columns based on space, comma or another separator.

Steps to use text to columns

- Select the data such as A2:A10
- Open Data tab → click on text to columns
- Choose the data type
- Select Delimited if data is separated by spaces, commas or other characters or if there is no delimited choose fixed width and click Next.
- Select delimiter as space click next
- choose destination cell and click finish.

If we choose fixed width

- In the preview, click where we want to split the data, Excel display vertical lines called column break lines.
- Click to add a line, double-click a line to remove it or drag it to another position
- Click Next, choose destination, click finish.
- To remove any symbol click ctrl + H
